

architectural–element width distributions by depositional setting and river pattern

including apparent and incomplete widths

architectural–element width distributions by basin climate and discharge regime

including apparent and incomplete widths

Boxplots and violin plots of thickness distributions of architectural elements for groups of analogues classified on combinations of river pattern and depositional setting (top panel) and basin climate and discharge regime (bottom panel).

Boxes represent interquartile ranges, horizontal bars median values. Data include apparent and incomplete width measurements (n = 9,786). NA indicates unclassified analogues.

AC: abandoned–channel fill, C: coal body, CH: aggradational channel fill, CR: crevasse–channel fill, CS: crevasse splay, DA: downstream–accretion barform, DLA: downstream–/lateral–accretion barform,

FF: floodplain fines, HO: scour–hollow fill, LA: lateral–accretion barform, LC: floodplain lake, LV: levee, SF: sand–prone overbank, SG: sediment–gravity–flow body
